

## Wave importing onto Tyros2's Hard Drive (Audio Importing)

On Tyros 2 there is an Audio Recorder facility, and if you have a Hard Drive you can import music from the computer, or from CD's. But if the music is in MP3 format, it will need to be converted to Audio (wav), before importing to the Tyros 2.

So here's how I do it, save the Wav. File from the computer, on to a USB "stick," press **Hard Disk Recorder – Select** – then press button (8 lower) **Change Menu**), now you will see **Wave Import** press button (7 lower), then – **Tab** to the "**USB 1,**" and select the song/track you want. Now it will then start to copy it to the Tyros 2's Hard Drive, note this may take some time, as Audio (wav) file are large, repeat this process for each track/song you want as audio on the (HD), you can assemble them into folder which will store the requires "song repertoires."

Conversely you may wish to export the Audio from the Tyros2, particularly because you can add your vocals to the performance, and the export to the "net." This can be done by either recording the song's backing first (recommended), as usual in the midi recorder, and when you are happy with that, you can start the **Audio Recorder**, (recording), just before starting the **Midi Recorder**, (playback), now make sure that the levels are correct, by selecting **Setting** and adjusting the **HD Track Play and Record Monitor** levels. Now you can add your vocal giving, you more freedom to enhance you singing, with the **Harmony** functions, again making sure the levels are correct. When this is completed, your performance can be exported to the USB pen, then via the computer, convert to MP3, onto the "Net."

The method with the **Audio Recordings** on the **Tyros2's HD** selects the song/performance, press **Hard Disk Recorder – Select** – then press button (8 lower) **Change Menu**), now you will see **Export** button (7 lower), press this then **Ok** button (7), now **Tab** across to **USB 1** press button, (6 lower) **Execute** to copy it on the **USB Stick**. Once this is complete, transfer the "Stick" to the Computer, and copies it onto say the Desk Top, for easy location, run the convert to (Wav to MP3) and it's ready for use on the "Net."

To make folder you need to press button (8 lower), **Change Menu**, back to Audio Recorder's "normal screen," and then copy them into the required appropriately named folder.

Then you could also make a play list by pressing button (8 lower), **Change Menu**, once again, and pressing button (6 lower), **Play List** (*edit mode*), and add the songs to the play list, then you can re-order them if you wish, now if you select the first song in the list, it will play all songs in (that play list).

Each of your folders then could have its own play list, so that you can select the one that you want. I hope this is helpful to you I haven't done much with the play list function, and there may be other ways of doing it.

I hope that I have been able to put you on the right track anyway. I am dyslexic so I hope this make sense to you, I do try very hard to be accurate and concise.

Colin.
